Antes de executar o sistema de conversão, importante configurar a pasta em que os arquivos serão gerados. Para isto, selecione o arquivo App.config do projeto New_CDN_iTaas, e siga os passos conforme a figura a seguir.

<add key="outputPath" value="[caminho da pasta]"/>

Na tag que possui a chave "outputPath", insira o caminho da pasta em value.

Ao executar a solution, será apresentado uma tela console com a palavra "convert", no qual o sistema estará esperando por uma entrada de string contendo o caminho do arquivo em formato "Minha CDN" e o nome do arquivo que será gerado em formato "Agora", conforme a especificação.

Para teste, foi utilizado seguinte texto

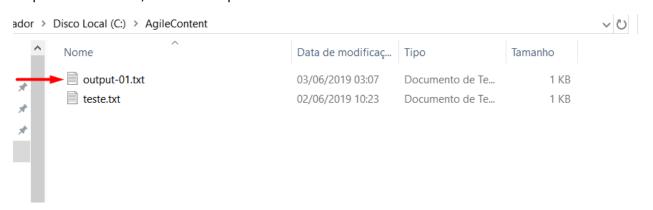

https://s3.amazonaws.com/uux-itaas-static/minha-cdn-logs/input-01.txt ./output/output-01.txt Após informar o texto, pressione a tecla Enter.

Antes de realizar a conversão, o sistema verificará se o texto informado é válido conforme a especificação. E também se consegue obter resposta do link informado (arquivo input).

Após a validação, o sistema irá realizar a conversão, podendo enxergar os dados obtidos no arquivo em formato "MinhaCDN" e a conversão dos dados em formato "Agora".

```

Ao pressionar o Enter, o sistema irá parar de executar.

E pode-se checar na pasta configurada o arquivo convertido para formato "Agora".
